### **IF I COULD INVENT SOMETHING NEW**

It will be an amazing thing if we have a society where truth, sincerity, and honesty are the order of the day. In this Twenty-first century, where everything is going technologically, I would invent a pocket-size lie-detecting machine. This innovative device, as compact and accessible as a smartphone, would analyze voice patterns, facial expressions, and body language to reveal the truth within seconds. Such a tool could transform our daily interactions, fostering a society rooted in transparency and trust.

The lie-detecting machine would work using advanced technology. It would have a small screen, a button to turn it on and a rechargeable battery, just like a smartphone. When someone speaks, the machine will analyze their voice, facial expressions, and body language to detect any signs of lying. It would be very accurate and quick, giving results in just a few seconds.

This machine would be useful in everyday life. In schools, teachers could use it to know if students are telling the truth about their activities, especially their homework. Parents could use it to understand if their children are being honest about where they were after school. This would help build trust and make sure that everyone is being truthful.

Additionally, this invention would be very helpful in solving crimes, being a useful tool for police officers and detectives who would use the lie-detecting machine during investigations to find out if suspects or witnesses are lying. This would make it easier to catch criminals and ensure justice is served. Courtrooms could also use the machine to help judges and juries decide who is telling the truth, thereby ensuring that justice is perfectly served.

Moreover, the lie-detecting machine could make relationships between two people last longer. Friends could use it to clear up misunderstandings and know if they can trust each other. Couples could use it to ensure they are honest with one another, which would strengthen their relationships. At workplaces, employers could use it to know if employees

are being truthful about their work, creating a more honest and productive environment and a friendly relationship between the employer and the employee.

However, it is important to use the lie-detecting machine responsibly without interfering in other people's private matters. People should not use it to invade others' privacy or to control others. It should be used to promote honesty and trust, not to create fear, mistrust, or insecurity.

In conclusion, a portable lie-detecting machine holds the power to enhance honesty in our society. From classrooms to courtrooms, and from family homes to professional environments, this device could be an object of truth, which helps in the cultivation of trust and justice. However, it is important to uphold this power responsibly, ensuring it serves as a tool for understanding rather than a weapon of control and destruction. By embracing this invention with ethical consideration, we can step closer to a future where integrity is the norm and deception will become a thing of the past.
