IF I COULD INVENT SOMETHING NEW

Before I commence, I would like to give an explanation of one aspect of the problems that our country Nigeria is facing, and how my invention can reduce it.

One of the problems that Nigerians are facing is lack of electricity which affects the productivity of some industries. Now how does it affect the productivity of industries? It affects the productivity of some industries in the area that some industries have been closed down because they could not afford the high cost of fuel or diesel to power their equipment. This has affected the jobs of some people and increase in the price of goods and services.

If I could invent something new like a power machine that only uses refined water as its source of power to supply energy for factories to power their equipment, companies that have been closed down would see reasons to re-open, and there would be less spending of money on the high cost of fuel or diesel daily to power their factories.

Also, water is a renewable source of energy which means that it can be naturally replenished and it comes from a natural source, unlike other resources that have to be refined to get their finished products.

The water for my invention can be gotten from sources like stream, lake or river. It would be refined to a very pure state that can be transferred to the machine. The machine would have a circular shaped hole at the top called the “fill hole” where the refined water is passed through a narrow tube called the “passage pipe”. Then enters into a large box called the “power box” which is where the refined water would end up into a spherical structure called the “power station”. The power station would then convert the refined water as a source of energy to power the factory.

My invention can also help to increase employment opportunities in the case that some companies that have been closed down would re-open and there would be no need to spend money on expensive fuel or diesel, because my invention of power machines that uses refined water would settle their expenditure on that aspect.

In conclusion, my invention of refined water power machine could help to reduce production cost for factories, unemployment for graduates, and the re-opening of some closed down companies. It can also help to reduce the causes of fire accidents in businesses and homes because water is a non-flammable source of energy.

Below is a diagram of what my refined water machine would look like:
