

IF I COULD INVENT SOMETHING NEW

My name is Ifenne Nnoli, I am a student at Saint Francis Catholic Secondary School Idimu in JSS3C, I come from Oraifite in Anambra but I live in Lagos. My teachers respect me for my eagerness to learn new things and to be challenged which makes me a diligent and hardworking student. If I could invent something new it would be a teleportation device.

Teleportation in simple words is the movement from one point to another in an instant without transversing the space between them. I envision a world where we can use teleportation to go from place to place in the blink of an eye, where there are no more traffic jams because of the use of cars and a world where transportation of items would be faster and easier. It could revolutionize our world and open so many opportunities for humans. However, teleportation as a topic is not a new one, according to Wikipedia the etymology of the word states that it was coined by an American author Charles Fort who explained it to be the appearance and disappearance of anomalies. The word was first formally used in the second chapter of his book 'Lo!' in 1931. Though teleportation is a mere science fiction scientists are working on a feature called Quantum teleportation.

Quantum teleportation is a scientific phenomenon in which quantum information is sent from one point to a farther location. Quantum teleportation could be the basis of energy teleportation which may lead to matter teleportation. I would like to join the group of scientists who are working on quantum teleportation because it would put me at the point of effective research and allow me to play a prominent role in shaping the world of teleportation in our world.

There are many potential benefits of teleportation to humans and our environment but I'll list a few here. During my research, I found out that teleportation could revolutionize our travel by reducing the stress of traffic jams, hold-ups and long trips, not only would it prevent stress, it would also reduce the wastage of time spent in travelling or transporting goods with ships, cars, airplanes, lorries etc. Its benefits also include saving the ecosystem and atmosphere by reducing or eliminating carbon emissions from cars, lorries etc. In addition to these, I feel that teleportation would save money used in running transport infrastructures e.g. train stations airports and seaports, give us time to spend with family and ourselves and give us the privilege to explore limitlessly without boundaries.

So, in conclusion, teleportation would provide a revolutionized world filled with many possibilities and opportunities to grasp. So if I possibly could invent something new, a teleportation device would be my contribution to the evolution of the world
