

IF I COULD INVENT SOMETHING

My name is Nnoli Chimdindu I am a student at St Francis catholic secondary school in JSS3B. I am from Anambra state and I live in Lagos state I indulge in sports like football, badminton and basketball I am a very athletic individual and I am hard-working and well-brought up. If I could invent something it would be an Animal translator

For me, an animal translator is a device which should help humans understand what animals are saying. If you have a pet you should try it on them. The history of animal translators can be traced to 5 BCE ago when King Solomon's ring reportedly helped him communicate with animals, and when Saint Francis Xavier communicated with animals in the wilderness due to deep meditation, but now in modern days we need to hire an animal specialist to thoroughly study animal behaviour and vocalization, linguistics to help us try to understand the language of the animal, and a tech expert to animals to implement the experiment for broader testing and evaluation of its effectiveness. I envision creating a revolutionary device capable of translating all human languages, specifically focusing on African languages. I look forward to making it an exquisite work so it does not have errors

The use of my invention is to enhance the relationship between man and animal and it would be a very exciting experience, which will lead to a greater understanding of life and how other creatures feel, and also an understanding that it isn't only us that have emotions. It will also serve as a very good form of entertainment. And it would help in some companies and help in errand running.

I look forward to making this invention, and with my technological skills, I will make sure that it comes out well and will provide support to other scientists. Although some scientists have tried many times to invent the animal translator but have failed many times. I will make it.

Now that I am working closely with Heirs Group, I believe my invention of the animal translator can now come true, so we can relate better with animals.
