

IF I COULD INVENT SOMETHING NEW

By: SOCHIKANYIMA FAITH ANTHONY-AGU

Port Harcourt

Humanity has it that 'life is hard' and yes, we all can agree to that fact. This is why we have technology in our lives today which has been brought about as a result of man's knowledge.

Stories have also been told about lots of inventors who have been congratulated and given gifts for their help towards enhancing the quality of life and making it comfortable for us. However, there are some disadvantages. For instance, not everyone can afford them. If I could invent something it would be something that everyone would be able to afford. My invention would be so affordable that even the poorest man would be able to buy it. Also, it will be so user friendly that anyone would be able to use it efficiently. One thing I can take note of is that creativity will be highly needed to achieve this feat.

Creativity means being able to think outside the box to produce something that will be beneficial to people and inspire them. In fact, what I would love to invent would make me the richest child in this current world. If I were to invent something new, I would first think about something that would revolutionize our generation, then invent it!

My innovative device would be a device that would be able to teleport people to the various places they want to go. It would come with a watch and a clip that can detect danger. Thus, if anyone is being kidnapped or killed, it would beep and teleport the person back home. The invention and its use alone will be so unthinkable that people will doubt it until they use it for themselves.

As earlier mentioned, the device will beep when it senses danger so one might wonder how it works. To answer this question, it beeps when one's heartbeat speed becomes abnormal. A chip would be added as tracker to determine the action of a human, whether it's a threat or not. This chip will also serve as a locator to show exactly where the person is.

The device would also be able to do other things like speak to humans, listen to instructions like send emails, make calls or lock doors, in case of a robbery attack, and it will do them. In the carton that will contain the device, there will be several small circular detachable objects that will be put at designated areas in the house to pick signals and commands when spoken to. My invention will help save lots of lives. I will call it 'The Teledor'.

In conclusion, I hope my invention will help to solve some of humanity's worst challenges and man's confusing problems. Its portable nature makes it easy to carry along, while its design can disguise it as an accessory. This unique approach is what makes it such a much-needed safety device. The teledor to the world!
