### IF I COULD INVENT SOMETHING NEW

Have you ever had a moment to place your mind on how inventions, substances or laws can save lives, change them and even make them easier and stress-free? Well, I have thought about these things and in my opinion, there are a lot of inventions out there that have affected individuals' lifestyles either positively or negatively. If I could invent something that is not yet in existence, it would be the cure to HIV/AIDS.

We are all aware of what HIV/AIDS is about and that presently there is no known cure for it yet. This is why I would like to invent a cure it. There would be many benefits to this cure. People would be able to live a long and healthy life. According to a survey from ourworldindata.org, 100 in 100000 persons die of HIV/AIDS in countries in the southern region every year. When the cure is invented, these numbers will surely decrease and people will have their whole life ahead of them. The medicine would be used to cure other STDs rapidly effectively as well.

You may ask, how would you be able to create a substance that can cure such diseases effectively? Viruses have codes [either DNA or RNA] that they force cells to copy. A sample of the virus would be collected to find the code that forces cells to make it replicate and then create a substance that can break the code because without the code, the virus cannot replicate or function. Therefore, I would have been able to find the cure by creating the substance that breaks the code.

To convince people living with such diseases to buy the product, there would be sensitization through the use of photos and videos giving full disclosure about the medicine and how it works in the body of an infected person. This would create public awareness and individuals living with HIV/AIDS and other STDs would be able to buy the medication at an affordable price. As such, the world would be rid of STDs.
