IF I COULD INVENT SOMETHING, WHAT WILL IT BE?

THE OZONE LAYER PROTECTOR

The world is changing extensively due to a lot of activities going on by human beings, animals, and even the firmaments. It is now imperative for a lot of inventions to be made in order to solve problems and meet the needs of the world. From time immemorial, there have been times when analog was invoked, then through digital technology, and currently to the use of AI.

Presently, if I could invent something, it must be something useful to the whole world. The health of the world has been negatively impacted over the decades. There are lots of diseases and sicknesses affecting the lives of human beings. For example, the recent outbreak of the Coronavirus disease which a lot of deaths were recorded. We've also heard of the ozone layer depletion caused by greenhouse gases. So I would like to make an ozone layer protector.

This will be made out of strong drones that are made from the strongest metal in the world which is Tungsten. Then I will create an oxygen compressor that collects 3 molecules of oxygen from the air and compresses it to become O_3 . O_3 is what the ozone layer is made of after O_2 has been hit by the ultraviolet rays of the sun. If these drones are taken to the stratosphere, they will replenish the hole that has been created in the ozone layer. If you may ask "Why do we need the ozone layer?" There are many reasons, and one of them is that it protects us from the harmful ultraviolet rays of the sun. As we know the sun is too hot for us and the ozone layer reduces the intensity. This is why we can live peacefully on Earth without complaining about sunburns all the time.

Recently, scientists have reported that the hole in the ozone layer has reduced although it is still very big. But we can reduce it even more if we can lower the usage of fuel. The smoke of the fuels being used contains the greenhouse gases that destroy the ozone layer. To also reduce the already present greenhouse gases, we must plant trees. If we can continue to produce battery/hydro-powered cars, we can keep the ozone layer to last for many generations which will need it. This is what will change the world and if we can put our mind to it, we can achieve it. As we do this the ozone layer will be replenished and this will provide a better world for us humans.
