

If I could invent something new

If I could invent something new that would be beneficial to mankind it would be a car that can fly and go underwater. It will run strictly on electricity and solar energy, it would be able to fit into parking spaces, it will also be streamlined to a percentage so that water will not be able to compress the body of the car, it will come with a hydroelectric engine so that it will be able to explore in the water bodies, it will not be affected by rainfall and it will be affordable.

Nowadays, especially in Nigeria there is always traffic jam which leads to accidents and also restrict individuals to get to their destination like office, appointment, school on time, so if there is a car that can fly it will help people reach their destination on time, faster, helps parents with school runs and also shorten the time of a journey.

Furthermore, it will help the government to reduce on the way they build and repair roads, bridges and flyover because in the air there is no traffic, it will also reduce the rate of road accident, road accident causes loss of lives and property, injuries and damages to people and vehicles involved and a large amount of money on repair. So with the help of a flying car road accidents can be reduced and it will help the government to channel it to more important things like healthcare, agriculture and so on.

After that, it will help in the transportation sector because since the president of Nigeria removed fuel subsidy it has affected the whole Nigeria which is leading to rapid increase of prices in the business sector so if you are into the business sector and you have a flying car it will help in reducing the expenses on transportation, reduce the cost of goods, it will reduce the effect of the removal of fuel subsidy, it will reduce the way we buy fuel and it will make a happy country.

It also helps in reducing health problems in the society since the car runs strictly on electricity and solar energy it reduces the combustion of fuel which leads to carbon dioxide, it also strengthen and reduce the depletion of the ozone layer which lead to a healthy environment because if we do not stop the depletion of the ozone layer it will cause solar radiation which leads to UVA rays which causes skin aging and eye damage and can lower your body ability to fight of illness and also contribute to the risk of skin cancer.

For instance, as Russia and Ukraine are having war with the help of flying car, it will help citizens to evacuate faster to a safer location or another country and reduce loss of lives.

Lastly, for research, not forgetting the fact that the car can go underwater which help people to discover and learn things about aquatic life, it also helps scientist discover more about aquatic life and how it is going to man's environment, it is also a safer way of researching.
