IF I COULD INVENT SOMETHING NEW

If I could invent something new, I am hoping to invent a robot that can distribute and collect student's script during examination. This is to reduce teachers stress. First and foremost, a robot is a machine that can do tasks automatically or with guidance, robots or humanoid robots can look like human or with human shapes. They are used in factories to do repetitive tasks quickly. Also robots do only what a person has built them to.

In addition robots can be used for improving computational thinking, robots in education are designed to help develop other cognitive skills in children such as learning from mistakes, also if I really want this invention to come to reality I will need many things to do. Firstly, it is by studying under field of robotics. Secondly, it is by studying more on how it can be programme and lastly, invent on robot that can distribute and collect student script. This can not only be used in examination. I would invent the robot so that it can help in education field e.g. writing notes for the students, setting questions for class-works, assignment, test and exam.

In addition we can also use it in result collation by standard examination body such as Joint Admission and Matriculation Board (JAMB), The West African Examination Council (WAEC), National Examinations Council (NECO), Basic Education Certificate Examination (BECE), or The State Primary School Leaving School Examination Board. If this invention comes into existence it will improve educational standard and reduce teachers stress.

In addition, a person or student who want to involve in things will be scientific and this can be don done been a science student and focus more on the data processing , because this invention can be done with the use of artificial intelligence and other

application system so as to get a perfect outcome of the robot and not to result into breakdown.

Also, this robot can come into reality with the use of electricity in charging it or the use of solar system but the use of solar system will be better because of the instability of power supply in Nigeria. The invention is going to come up with a solar panel. This is because the solar sellers did not give it up in an affordable price, the robot should be invented with a good battery on 45 watts so that it will be able to do more complex work.

Lastly, I hope this invention robot will be affordable and it will not require more labour stress and makes life easier.
