School: Bishop Howells Memorial Grammar School
Class: JSS2 Peace

IF I COULD INVENT SOMETHING NEW

If I could invent something new, it would be a device called the "Eco-Friendly Home Manager" (EFHM). This device would help us live in a more environmentally friendly way by managing energy use, waste disposal, and resource use at home.

The EFHM would be small and easy to use, fitting into any household. It would monitor how much energy we use and suggest the best times to run appliances like washing machines and dishwashers to save electricity. For example, it would tell us to use these appliances when electricity is cheaper and more available.

A special feature of the EFHM would be its ability to sort household waste. With smart sensors, it would separate recyclable items from non-recyclable ones, making sure we throw away less waste. It would also give tips on reducing waste, helping families adopt better habits.

Water conservation is another important aspect the EFHM would address. It would monitor water use in real time, alerting homeowners to leaks or high usage and suggesting ways to save water. For instance, it could recommend taking shorter showers or using water-efficient fixtures. In areas with water shortages, this feature would be especially useful.

Additionally, the EFHM would have a smart garden management system for home gardens. By analyzing weather and soil conditions, it would provide gardening advice, ensuring plants get the right amount of water and nutrients. This would improve plant health and reduce water waste, encouraging urban farming.

The EFHM would also include an air quality monitor to detect pollutants or allergens in the home. It would suggest ways to improve indoor air quality, like using air purifiers or adding plants that clean the air naturally. This would help keep the home environment healthy for everyone.

To make sure everyone can use it, the EFHM would be available in different languages and customizable for different household needs. It would come with a mobile app that allows users to control and monitor their home environment from anywhere. The app would provide detailed reports and insights, helping families make informed decisions about their resource use and environmental impact.

In conclusion, the Eco-Friendly Home Manager would blend technology and sustainability, helping people manage their homes more efficiently and adopt eco-friendly practices. This invention would contribute to preserving our planet for future

generations. If I could invent something new, the EFHM would be my gift to the world – a step towards a greener, more sustainable future.
