

NAME: IBIAM AONDREA

SCHOOL: KASSIE BRAUN MEMORIAL SCHOOLS

CLASS: JSS 2

IF I COULD INVENT SOMETHING NEW

I have been thinking how I can make the world a better place, how I would impact the society. Then I thought to myself, what if I invent something? That would be a great idea, but what would I invent? An aircraft already exists. A sensor camera already exist, we even have E-houses. Just as I was about to give up, an idea popped in, what if I could invent an AI Powered Sorting Machine that would operate on metals from non metal materials.

I searched through the internet and to my greatest surprise; I found out that a sorting machine already exist. I didn't give up but instead I decided to modify the device and take it to a whole new level. My idea was birthed by the eco-anxiety because I know full well that our climate is not in good shape and there are lots of metals and non-metals lying around making our condition worse. I concluded that the best way to impact in the society is to solve this problem that has endangered and affected a lot of people.

My machine would be voice sponsored, which means that it can detect plastics and metal materials in our environment, separating non-metal materials from metal materials. The machine would be coupled with another machine that can scorch waste and use as fuel for the machine. The idea is that nothing should be a waste; rather this machine will eliminate environmental pollution and still enable us to find valuables that have been lost in the environmental pollution.

The next question would be how would this machine detect these materials and attracts it into the first trolley before separation? This idea sounded a bit unrealistic for most people when I told them. They obviously said stuff like; you can't simply achieve this. This work is too much to make. Within myself I know this machine would really impact the society.

I feel my invention will save countries the worry or anxiety of losing their homes to pollution. I feel my machine will be a long-awaited solution; it will be something the world will be proud of. Achieving it would require a lot of energy and resources like money and materials. The skill and the zeal to achieve it could seem very tasking and technical, especially when you are being criticized by a lot of people.

Personally, this invention of mine would help me achieve my dream of improving the society, impacting the society and helping the climate. It would be a thing of joy if I could save my world.
