Class: JSS 1

Easy Topic: If I could Invest Something New

Over the centuries we have had many inventors such as Thomas Edison who invented Light Bulb, Alexandra Graham Bell who is credited with Telephone Invention and Benjamin Franklin just to mention but few who have used their various inventions to change the world in a positive way.

In following the traditions of these great inventors, I will like to invent a solution to one of the problem Nigeria is facing at the moment. The Issue and challenges of food security such as seasonal Tomatoes scarcity, this problem is partly due to lack of Storage facility.

So, the question of “**If I Could invent something new**” I will therefore research and invent a mechanized storage facility which will serves as storage for the tomatoes and other seasonal farm produce.

This mechanized storage facility will ensure that these farm products (Tomatoes and others) are adequately harvested and stored during the product peak season and supply to the market during the off-season period thereby make the farm products available to the market for the consumers throughout the years and thereby eliminate the perennial scarcity witnessed during the products off season.

Furthermore, in bringing this novel invention to life, 90% materials for the construction of the Storage facility will be sources locally while the remain 10% will be sourced from oversea. These materials range from Metals, Fibers, industrial compressors and Pipes with solar panels to ensure uninterrupted supply of power for sustainability purpose of the storage facility. The manpower both skill and unskilled for this project are abundantly available in Nigeria.

The idea is to construct a storage facility that will serve as commercial purpose, the size of the facility will be a big one Measuring 100ft by 200ft on a land mass of 2actres of land with solar panel constructed on top of the facility for constant power supply.

The estimated cost of the invention is (=N=10,000,000.00) Ten million Naira Only per unit of the storage facility, Although the cost could be driven down when the order is on the rise and demand Increases.

In conclusion, My Mechanized Storage facility invention if given consideration will not only guarantee food security for the Nation but will also generate employment opportunity for the

jobless youths in the country not forgetting the foreign exchange earning potentials for the country as well.

The problem of food security is not only affecting Nigeria alone but also a concern to the world in general and this explained why United Nation through its SDG Goals is working around the world with her various initiatives to ensure food security and banish famine in the world at large.

I believe my invention could also be of interest to the global body as well if given the due consideration by your honorable judges.

Thank you.
