ABUJA

CLASS: JSS1

ESSAY TOPIC: IF I COULD INVENT SOMETHING NEW

There are so many things I could do if I could invent something new. Let me start by explaining the two important terms which are “invent” and “new”.

To invent means to create, develop, or simply put, make a new thing. If a person chooses to invent something, he or she needs to consider the following, the invention you want to create, the limitations and/or problems of people around you, solutions to the problems, and the materials available in the environment.

The word “new”, means different, extraordinary, or excellent. When an inventor wants to create a new thing, there is a step-by-step process by which the ideas come, hence, it is necessary to get a suggestion, make guesses, and get to the conclusion of all the processes. To be a creative inventor, you have to make your ideas beautiful and transfer them to the designs. Teamwork can also be employed, so to achieve a common goal, get assistance from an experienced person.

If I could invent something new, I would invent a safety device called a *Safety Shirt*. It would have an inbuilt, high technological protecting circuits to boost and increase its protection. It would have an inputted technology that can protect the body against injuries, as would have a substance that makes someone have a soft landing when there is a fall.

In addition, I would look at the Marketing or Commercialization of the Safety Shirt. To do this, I would organize Trade fairs to market at low prices depending on the stages of the shirts. The first stage is for toddlers, the protection would not be as strong as the one for adults. The second stage is for adults which would have higher quality and thickness. The first stage (lower quality) would go for sixty thousand naira while the second (higher quality) would cost a hundred naira.

Furthermore, I would invite people from far and near to take part in the Trade Fair. Other product markers especially in the textile, fabrics, and clothing industry would also be

contacted and partnered with not only to showcase their products but also to collaborate with them for better sales. People of lower living standards would not be left out, they could buy the products at promo prices. This could be achieved by partnering with Non-Governmental Organisations (NGOs), International Sponsors, Corporate Organisations, and Brand Ambassadors for their sponsorship at the Trade fair. The partnership would aim to promote and finance the invention.

Lastly, I would employ authorized, certified, and registered distributors who would take the products to communities, countries, regions, and continents. Unlike some other new inventions, I would ensure that the quality of my invention is intact and consistent over the years.

In conclusion, if I could invent something new, I would invent a good quality but affordable safety shirt to protect people and save their lives.
