IF I COULD INVENT SOMETHING NEW

On a hot sunny afternoon, while I was going along the street, I saw a builder climbing a six story building with a ladder to fix a roof on the house and the builder looks like he was going to fall while climbing the building risking his life to earn money for his family. Shortly, when I reached home, I started thinking of what to invent, so I thought of a way to make it safer for builders to climb buildings to fix roofs or thunder protectors.

The first thing I thought of was a balloon that can float up to the roof carrying materials to the builder to fix the roof but then, I thought of the disadvantage which is the balloon could burst easily and might not be able to carry heavy load because of its lightness, then I thought of something else. This will be a ladder that can lift up itself to the top of the roof. The advantage is that it can be safe but the disadvantage is that the ladder can't carry heavy load and if it does, the joint of the ladder which make it long would break and the builder would fall to the floor and get seriously injured.

Again, I thought of an electric elevator which can lift people to the roof. This one has many disadvantages and some advantages. The advantage is that, it can carry heavy load and it's faster. The disadvantage is that, if it carries you inside the elevator and the energy source powering it fails, you will get stocked inside it and you'll have to wait for the power to be restored before you can move.

The final decision I made is to make a device called a 'lifter' that can carry heavy loads and doesn't need electricity. The advantage is that it can stretch to any height for a builder to do any work he wants to do. The disadvantage of it is that if it can't stretch to the length of the building, the builder can't do his work. What I will do as the inventor is to make it in different sizes and make it in a way that it can do different types of jobs for people, whether builders, engineers, ship makers or submarine builders.

If someone doesn't like my invention, I wouldn't mind because it will help in the society in many ways and people will thank me for my invention.
