SCHOOL: GREAT TOP NOTCH INTERNATIONAL SCHOOLS

IF I COULD INVENT SOMETHING NEW

To invent something simply means to create or design something that has not existed before. The word invent is not just an ordinary word because behind everything that has been invented there are thoughts, ideas, laws, and theories that were put together to ensure that invention of machine or object took place. This implies that to invent something is not that easy because in order to invent you have to think, gather ideas, and most importantly face your challenges.

If I could invent something new what could it be? There are so many things I wished to invent. But as a future optician I wished to invent an artificial eye that will enable the blind to see.

This artificial eye will be an object or technology that will look exactly like an eye that will be inserted into the eye socket. This artificial eye will be connected to the brain just as the human eye is connected to the brain.

This artificial eye will comprise of lens, cornea, optic nerve, retina, etc. all this will enable anybody that the artificial eye is been fixed into his or her eye socket to see things clearly.

Another reason while I wished to invent this artificial eye is because there are about 40 to 45 million people out there that are blind and 135 million of people have low vision in 2023 according to world health organization. All blind people wished to see the world again. if this artificial eye is invented, it can be sold to these 45 million people that are blind and 135 million of people with low vision that wished to buy and change their defaulted eye, a lot of money will be made from selling these artificial eyes.

This artificial eye will do more good by liberating the blind from blindness and other eye defects. it will also enable the blind that can now see to bring out their own initiative that will help to boost the economy.

The importance of this artificial eye is that it serves as a critical aspect of creating an inclusive and equitable society.

The invention of this artificial eye will benefit many blind people, country and economy. the most significant benefits of this artificial eye are: access to information, increased independence, enhanced communication education

the advantage of this artificial eye to the country and economy is that it will boost productivity. blindness often leads to decreased productivity and job losses. However, restoring vision with this artificial eye can empower individuals who are blind leading to increased workplace efficiency and driving economic growth.

in conclusion, blindness shouldn't be a barrier to accessing information or participating in

daily activities. with this artificial eye, individuals who are blind can engage with technology, written content, daily task and communication just as effective as anyone else. the invention of this artificial eye will help eradicate blindness from the world and also improve the economic growth of the country.
