

IF I COULD INVENT SOMETHING NEW

We are asked to write an essay about if I could invent something new, before I start I will like to define the term invent

INVENT: invent means to think of and plan something completely new that did not exist before.

Someone that invent things is called an **INVENTOR**

AN INVENTOR: An inventor is someone who thinks of and plans something completely new.

Am here to write on the topic that state,

A MIND- READING MACHINES

A mind reading computers system presents and information about your mental state as the keyboard and mouse present the text and command.

In our time things have changed a lot, our technology advances each day making new technology and making unreachable dream a reality.

The important of mind reading is a high impact in society, it will change everything, such as privacy issues since you can just read anybody mind and ideally be restriction.

In result mind reading can change the world, before doing the research on mind reading, I came up with hypothesis that in order to utilize your mind- reading skills you must be smart and have the technology. Also is mind reading possible or impossible it's a no brainer since if you not smart or average smart you suffer mental retardation.

The goal in building mind reading machine is to enable computer technologies to understand and react to people's emotions and mental state. The system is based on a multi-level dynamic Bayesian network classifier which model cognitive mental state as a number of interacting facial and head displays.

The machine might even be able to react to those command by say moving a dot across a TV screen, a computer can in a very real sense, read human mind.

Mind reading allows us to make sense of other people's behavior predict what they might do next, and how they might feel.

Their ability to mind reading abilities are thought to be the primary inhibitor of emotion and social understanding in people diagnosed with autism.

Mind reading machines will be able to detect any suspicious activity from human.

Here, the focus is on mind reading mechanism, which is indispensable in human's activity and evil thought, I propose a model of utterance understanding based on this mechanism. My hypothesis will be following; by reading human's mind robot can estimate the objects intention with ease. And moreover, it can detect all the thought from human's brain by sending a ray.

At first I would write the advanced algorithm code for my robot that algorithm with analyze the human's nature and their thought though its data base system. It will have 3D vision, object and sound recognition camera to detect the human's activity.

These are the mind reading system

1. Intentionally detector (ID): this model is a perceptual devices that interprets motion stimuli in term of the primitive volitional mental states of goal and desire.
2. Eye direction detector (edd)
