

NAME: SUBAIR AYODEJI

CLASS: Junior Secondary School 2

IF I COULD INVENT SOMETHING NEW

Robotics, Nano-Technology and Quantum computing combined would give humanity a chance to change and optimize Technology. My invention called Ruby is a quantum operating Nano technological robot. A robot is an actuated human size biped robot, with a torso, arms and a head, design to achieve some or most human capabilities. RUBY is a realistic humanoid robot capable of performing tasks on any terrain

There are some component of Ruby that has been ameliorated by upcoming Technology such as: generative AI. I have been able to come up with a non programmed robot which only works from human behavior. RUBY has the ability to adapt and interact with human and their environment. Agile and non invasive works with an existing IT and governance meaning RUBY can work without interference of any kind, no human error and human effort shifted to value adding task that involves interaction, judgment and interpretation improved job satisfaction leading to new value. Faster deployment of services, fast automation of processes and rapid integration of front end digital Technology with back office legacy environment. Increased operational agility enables Ruby to perform tasks according to demand.

Due to Nano Technology, Ruby can be able to regenerate when harmed. Nano Technology is a type of Technology that uses mechanized cells. These cells can enable the user to wear RUBY. This can come in handy because RUBY is water, shock and bulletproof. For security reasons RUBY can analyze any emergency situation and bring out solution.

Quantum computing enables RUBY to find solutions to problems more than a regular humanoid robot's computing system will. Quantum is energy proportional to magnitude to frequency of the radiation it represents which is relatively convenient. The way quantum computing works is that it finds solutions to problems faster by deploying more ways it can be solved. This enables RUBY to solve any problem cure diseases due to quantum computing. This makes RUBY robot that can recommend medicines using modern and ancient methods.

RUBY has other features which can be of use to the owner. RUBY can give advice due to intensive research by the quantum computer located at the torso of the robot which can gather information from other human experience. RUBY can also be connected to any type of device but only and automated voice would be functional on your phone. It also does holographic calls due to the projector on its frontal torso.

RUBY can be a game changer for humanity due to upgraded technologies it uses. RUBY can be taken to any place including space due to its titanium body and thermal glass protection. More of these types of multifunctional robots are needed in the world to help humanity reach heights thought to be impossible using renewable energy to prevent any harm to our planet
