

# IF I COULD INVENT SOMETHING NEW

In the streets of Nigeria, filled with resilient and hardworking citizens, who work relentlessly to feed their families. Men and women suffer from the rising effects of environmental hazards, such as, rising temperatures; which have been caused by constant change in climate, low energy levels and poverty, thus has led to no sustainable development of human lives. What is climate? There is more to this phrase “climate change” other than it been the change, in the weather of a particular place over a long period of time. It is referred to as a long term warming of the planet, which is primarily caused by the increasing levels of green house gases in the earth’s atmosphere. Now these green house gases have a huge role to play, regarding the issue, they trap and prevent it from going to space, leading to a rise in global temperatures. Now how do Nigerians contribute to this problem? It’s quite simple, the high dependence on fossil fuel such as coal is one of the lea drop factor. When we over use these fuel, it leads to an increase on it’s negative impact on our health and environment.

Nigeria, despite been the giant of Africa, still has a lot of work to do in terms of climate change, because, it have caused setback to the progress of Nigeria’s economy. Some countries like Portugal and Norway have made significant progress in addressing climate change. All these issues have given concern, seeing such a great country like ours, suffer from such a complex issue. Now why do I want to invent something new? It’s quite simple. I want to invent something new, that will not just save lives but will also change the bad situation in our country today.

Introducing the “Solar shield”, a highly heat resistant solar panel that has the capability to absorb sunlight and by this, reduce the earth temperature by reflecting excess heat back into space. Now how does the solar shield work and how would it control the effects of climate change? It’s quite simple. The solar shield is a revolutionary solution that can address these issues simultaneously. The solar shield would be placed close to the sun in an orbital placement similar to the position of the ozone layer in the stratosphere. The solar shield comes with another advantage, the AOH (Absorber of heat). It is a conductor that would be able to convert heat to electricity and is the cleanest way to connect and transfer heat back to the earth in form of electricity.

Think for a minute, how life would become if the solar shield system was implemented. Nigerians won’t have to depend on fossil fuels anymore, because of this life changing innovative solution. The solar shield would be very affordable.

IF I COULD INVENT SOMETHING NEW, I WOULD INVENT THE SOLAR SHIELD SYSTEM.
