

IF I COULD INVENT SOMETHING NEW

The intelligent creator made raw materials of all His creatures, man being the center of his work. Possessed with the ability to turn these raw materials into semi-finished and finished products, inventions from one human age to another kept enhancing the beauty of the world.

What does it mean to invent? It means to create or design something that has not existed before. It equally means to be the originator of a concept, idea or an object that will enhance human lives.

Individuals like Adam Bell, the Wright brothers, Thomas Edison and several others who made living easier by inventing great things had immortalized their names.

The world is changing and these are made possible through inventions. It had been thought that iron could not fly in the air but the Wright brothers believed otherwise.

I have been so curious to join those who have made the planet earth a better place than they met it. The possibility of having a means of traveling to the deepest part of the sea, oceans and any other water body without losing such means of transportation as well as those involved in it has been on my mind. If the wavelength of the depth of the sea can be calculated, and the depth determined through echo, then there should be an estimated if not the actual force of the wave of the sea at its depth which in turn could give idea to the strength of such an important vehicle to convey researchers safely to the depth of the sea.

Why the depth of the sea? It is believed that the earth is one third covered with water, and other items of value to the planet earth that can be unraveled if a trip to the depth of the sea is a successful one.

Again, these water bodies had swallowed a lot of valuables in areas like the Bermuda triangle and even cities lost to history. A successful voyage to the depth of the ocean will go a long way to enhance, enrich and widen the scope of man on his sphere of domain.

Since the expanse of the earth covered by water is large the breakthrough will also be a groundbreaking opportunity for new careers which could make our earth safer, more peaceful and habitable and could engender so many breakthroughs in other areas of human endeavor be it health, economy, socio-cultural beliefs and religion.

If space travel has become a normal adventure despite the hotness of the sun, why should the sea which seems less harmful than the sun become a dreaded sphere in human advancement despite our level of sophistication?

I am curious, anxious and adventurous to see a suitable invention that will put my curiosity to rest. Hence, if I could invent anything at all I would like to have a rocket-like machine that will harmlessly take researchers, scientists and sea-based professionals to the depth of the ocean.
