### **IF I CAN INVENT SOMETHING NEW**

I would love to talk on the topic on if I can invent something new. For me, if I was to invent something new, I would invent a building machine. The building machine will be designed to build a house under a short period of time. For example, you just put the materials for building into the building machine, under a few hours the machine would finish building the house.

Moreover, if you want to build a machine you must first be able to get the parts and materials for the machine: the material shall use iron to cover the body part of concrete or cement for the machine.

Furthermore, the main purpose of me wanting to invent the building machine is because it is more efficient machines can work faster than humans, reducing build time and minimizing errors and the invention could lead to new buildings materials, techniques and architectural designs. The machine could build houses in remote areas, improving access to housing for underserved communities.it would also help in terms of job creation, while the machine builds houses, it could also create new job opportunities in maintenance, programming and operation.

Such a machine could be easily replicated and deployed in various locations, the machine would combine eco friendly materials and energy efficient feature. The machine would also minimize construction site hazards and risks for workers.

Lastly, a house building machine could significantly reduce construction costs, making housing more affordable to people. The machine would ensure consistent quality and design which will eradicate the problems of buildings collapsing.

Thank you.
