IF I COULD INVENT SOMETHING NEW

In the society, there are different problems and situations that trouble mankind. There are problems which are considered unsolvable at every angle to people all over the world. These problems are very dangerous and some can be very hazardous. Some problems are actually easy to solve, but only very few people put the effort to solve them. Some of the problems challenging the world today include; desertification, drought, volcanic eruption, deforestation, constant health issues, air pollution, water pollution, soil pollution and so on. Some of these are mostly based on the environment but the most devastating, wide spreading, powerful force in this area is global warming.

Global warming has an intense effect on the environment, to the extent that it has caused the loss of billions of lives all over the world. This is an issue often overlooked, but is still one of the biggest threats to mankind; it is caused by many wrong decisions which we human beings have made and are now facing the consequences. This is stated from the fact that we, human beings have been increasing global warming through the use of machines which release green gases which as well affects the ozone layer and the environment at large. These green gases have greatly affected our beloved environment, these dangerous green gases include; methane gas, carbon oxide, monoxide, and so on. The gases stops radiation gotten from the sun from going back into space, but is rather bounced back and forth on the earth's surface. It also damages the ozone layer which protects us from the harsher rays of the sun.

With any more of this, the world will become too hot and harsh for living organisms by increasing wild fires, desertification, volcanic eruption and so on, thereby reducing life on earth to a very little extent and send us extinct.

If I could invent something new, I would invent a machine that would stop global warming and restore normal temperatures. This machine would be called the **ECO CLIMOSPHERE**. This machine would run on hydro electric power and be stationary; it would be a machine that would restore the ozone layer completely in order to keep the harsher and more radiated rays of the sun at bay. It would as well be able to undo the damage done by these harmful gases and neutralize them completely.

This will thereby change the climatic features and stop this threat in a very short period of time. I want to change the world around me thereby making it a better place for inhabitation. If this happens, the earth will be sustained as a happy, peaceful, life inhabiting planet and the ecosystem will be maintained. This would as well reduce the occurrence of drought,

desertification, volcanic eruption, heat waves, over flooding, soil malnutrition and so on. This would as well reduce health problems; the earth is our home, and we should always strive to protect it. This is my way of contributing to it.
