

IF I COULD INVENT SOMETHING NEW

When it comes to invention, it is very necessary that we look out for things that will make much impact to the society at large. One of our major problem presently is cybercrime which has affected almost everyone across the globe. Cybercrime can be checkmated or prevented by I inventing **cyber security tools** .

Cyber security tools are tools which I can invent to tackle the problem of cybercrime or internet fraud. These cyber security tools can be inform of creating an artificial intelligence that will protect all personal passwords and privacies that one has. It can also be inform of creating an interface or a user-friendly medium which will guide a victim of cybercrime on how to recover a stolen privacy and also guide the victim on how to authenticate his/her credentials after recovery.

Cyber security tools are advanced tools which are developed or build with the help of high programming language like java , python, c++ which are the most efficient and protective programming language. Java programming on it's own is one of the strong programming language which I can use to build cyber security tool . My reason is that java does not support multiple inheritance; therefore, it will be difficult to hack a tool which is built on java. Python programming language is also recommended. My reason is that with the help of python programming, I can easily write a code to recover a hacked account from hackers. Another example of cyber security tool which I will also build is a Block chain application that will guide all internet voting and any other form of online election on the internet to prevent our votes from been manipulated.

Other than cryptocurrency , I can now with the aid of my cyber security tools build a specific block chain that can monitor any form of online election and it can be accessed from any side of the world.

Hence, with the help of cyber security tools, business enterprises both large, medium, and small enterprise can now protect their accounts , files and any form of credentials with my new invention.

In conclusion, I can definitely invent something new by creating cyber security tools that will help me tackle the above problems and also help me resolve the issue of insecurity by allowing me gain access to the satellites and hence uses it to monitor a

particular region and also guide their affairs by the supervision of government agency like the air force.
