

NAME: Omeodu Testimony

SCHOOL: Bloombreed Schools

CLASS: Year 7

Title: IF I COULD INVENT SOMETHING NEW

There are different unsolved problems in our world today, especially in Nigeria. These problems will need to be solved. Some of these problems include a dirty environment, pollution and so much more. Furthermore, there are some environments that are so dirty that they attract numerous pests. Now these pests carry diseases, for example a rat causes Lassa fever.

There are also some diseases associated with dirty environments aside from diseases caused by pests. Some include asthma and allergies. This can occur when air pollution is present. Poor sanitation can cause cholera and dysentery.

If I could invent something new it would be “A Sanitization Robot”. This machine would be capable of performing numerous tasks in the environment, world and society. My robot would be a compound of different bots. It would contain some components like sensors, diodes, capacitors, motors, batteries etc. To increase the efficiency of the machine.

It would have the ability to sweep away broken pieces of glass or container. This robot would also be capable of maintaining its immediate environment clean and tidy at all times.

In conclusion, with this robot the environment would be able to be clean, tidy and presentable. It would also create a peaceful and enjoyable atmosphere for living.
