### **IF I COULD INVENT SOME THING NEW**

If I could invent some thing new, I would invent a machine that would eradicate cancer. It would be called " THE CANCER ERADICATOR " . The cancer eradicator will be used to eradicate cancer cells and biomarkers in the immune system of the body.

It will take the form of a mechanical chipped spider or tablet. It would be inserted into the body through oral process( mouth). While inside the immune system , it will release Antibiotics artificial cell , to the exact location where the cancer cells and biomarkers are spotted and intercept them , with an anti cell gas ,that will eliminate them. After eradicating of the cells the cancer eradicator will pass through the intestines and come out through the anal canals, and will be brought out by the operator with retractors or on its own .

The cancer eradicator will be made from advanced Nanotech and artificial intelligence .The body of the eradicator will be made from steel, microscopic scanners for eyes and an inbuilt sensor for the ability to identify and differentiate between the blood cells and cancer cells, and a thorax with an inbuilt pipe where the anti gas will pass through . It will also have an AI (artificial intelligence) intercom as a brain and an inbuilt tracker to trace the cancer biomarkers in the blood and a GPS to know the location of where it is in the body.

Through the help of this technology we could cure the different types of cancer cases there are, from breast cancer to cancer of the cervix, to cancer of the tissues and many more. With this no more cancer patients will die , no more piled up cases of cancer and no more broken families and cancer cases would be eradicated .

We could stop the spread of cancer among the youths and old aged and the reoccurring cases of cancer in our countries . We would save a lot of patients and new Borne . We would save a lot of lives suffering from cancer And cancer would be no more.

**So let's start with one and save all. Thanks.**
