**If I could invent something new (The "Schoolwork Tracker").**

The world has had many great innovations, from the Airplane by the Orville Brothers, the Computer by Charles Babbage, and to the world's greatest innovation, the Internet, which has positively affected the way we live, work and communicate with others. With all these and more, I have been inspired to make my own thing, I call it the "Schoolwork tracker."

The challenge with students nowadays is being up to date with Schoolwork and staying organised. Unlike other methods such as Homework diaries and so on, the Schoolwork tracker is more efficient, productive and more organised.

The Schoolwork tracker is a table built-in computer that helps a student to organise notes and School activities. This device records a range of learning activities and has the ability to store data and automatically reminds students when needed.

It also helps in identifying missing notes by tracking your movements around and point out possible places it might be.

Manufacturing this device would require partnerships and collaboration with tracking, storage and computing industries with the supervision and funding of academic institutions to enhance device performance.

The primary benefits of this device are students from elementary to tertiary education and schools who are willing to adopt better ways of making organization of school work more effective.

Distribution would be made to different schools and feedbacks are open to students, teachers, and school authorities alike. This would facilitate testing and improvements on various aspects.

The challenge in making the Schoolwork tracker is the cost of production and purchase. Many schools with the level of their funding might not be able to purchase and maintain this device, and with the problem of inconsistent light in the country, devices can easily get destroyed.

The solution to this issue is for the government to invest more in digital education, encourage academic institutions to adopt this concept, and, to improve power supply in the country.

The long term goal of this device is to enhance a productive learning environment, improve Nigeria's educational system, and make a significant technological advancement in Nigeria and making room for others.

We all believe that student organization is key to their success, therefore making Schoolwork more efficient is what we should really focus on and strive to achieve. I believe that the success of our students tomorrow is a product of what we invest in today.
