NAME:UDOH ESTHER GODFREY

TOPIC:IF I WERE TO INVENT SOMETHING NEW

SCHOOL:THE APOSTOLIC CHURCH GRAMMER SCHOOL

IF I WERE TO INVENT SOMETHING NEW

To invent means to make or design something new. If I were to invent something new, I would invent something out of existence, I would invent a machine that will be of great advantage around the world and also a machine out of my liking.

I would   invent an eyeglass that can detect diseases in less than five (5) minutes just by wearing it. Imagine how amazing that would be.

Firstly, an eyeglass is a single lens for correcting or assisting defective eyesight, especially a monocle, some eyeglasses are worn for beautifying the face, those kind of glasses don't have prescription.

To make this invention, a flash green light will be inserted on one of the hands of the spectacles.

Spectroscopy tells us that blood absorbs green light because red and green are opposite each other on the color wheel. This invention will also contain an optical sensor to detect the reflected light.

Having an eyeglass that can detect diseases comes with so many importance one of which is helping individuals know that they have contacted a disease or sickness, most people are so busy that they don't have time to go for checkups in the hospital while some are poor and don't have money to go for checkups.

Another importance is that it helps in early detection of disease which plays a critical role in preventing deterioration caused by any disease. Detecting these conditions in their initial stages allow for prompt intervention and appropriate management which can significantly slow down or even halt their progression.

Moreover, wearing an eyeglass that can detect any kind of disease will reduce the death rate in the country, most people die of sickness and diseases they didn't know that they had due to loss of time or lack of money to go to the hospital. If this glasses were to be invented, it can help increase the population and help save more lives in the country.

With my invention, we will be able solve world problems of people dying from diseases by detecting it on time before the case gets critical.

However, it can also help to save money because when diseases are detected in their initial stage, the money spent on the disease is less then when the case gets worse.

In addition to that, when cases are taken to the hospital after running test for an individual it takes days for the result to be out but with this invention it takes than five (5) minutes to detect the disease.

In conclusion, I hope this idea of mine can come with into reality, it will be a pleasure to be the mind behind an invention that will be of great contribution in saving more lives and preventing death caused by any kind of disease or sickness.
