## IF I COULD INVENT SOMETHING NEW

Imagine a world where robots not only perform tasks but also understand and react to human emotions. This futuristic scenario is no longer confined to science fiction; emotional robots can become a reality. If I could invent something new which will be beneficial to mankind, it would be a robot that can respond to human emotions. We, humans, have different emotions that can affect us in diverse ways. Negative emotions are capable of taking the best of humans if not properly managed. Therefore, I am interested in pursuing the invention of the robot based on the context presented below.

An emotion is a strong feeling derived from one's circumstances, mood, or relationship with others. There are different types of emotions such as love, fear, anger, hatred, happiness and so on. This robot will be programmed to have, recognize and interpret human emotions in order to actively relate to the humans and their emotions. When developed, the robot will have the ability to productively sense human emotions, interpret them and understand the reason for the display of such emotions as well as provide assistance to the human being based on the emotion on display.

I will especially recommend this machine for people struggling with anger issues and spontaneous display of intense anger even for flimsy reasons. The robot will be very important to assist such people to resolve their anger crisis. It could also help others who are not suffering from intense anger challenges to provide counselling assistance for the victims of inhuman treatment and abusive language based on expression of anger.

It is important to emphasize that the robot, when created, will be available in different shapes and sizes to suit the preferences of the users. It can come in a smart watch form for those who prefer to carry it around, and can also come in an app form. Essentially, the robot will provide the users with advice and immediate solutions. Emotional robots, equipped with the ability to recognize and respond to human emotions, will offer promising applications in fields like healthcare, elderly care, and disaster response.

In addition, here are some benefits of an emotional robots:

• Enhanced human-robot interaction: Emotional robots will bridge the communication gap, making interactions more natural and intuitive.

- Therapeutic applications: They will provide mental health support and companionship for the elderly.
- Safety and adaptability: Emotional robots will have the functionality of predicting and responding to critical situations based on human reactions.

In conclusion, it will be fun to use an emotion detector which will resolve most of the world's problems. This is because most of the world's problems are caused by the failure to manage human emotions in responding to people, environmental issues and lots more. A society that is prevalent with people who have their emotions under control will likely be a progressive and productive one.
