SCHOOL: EMERALD DAY SECONDARY SCHOOL, LAGOS.  
CLASS: YEAR 8.**

### **IF I COULD INVENT SOMETHING NEW.**

An invention is a creativity of you. It's speaking about your passion for a particular creativity. Invention broadens your scope to a particular invention. I would like to be an inventor in the field of engineering, so that I could invent a **teleporting machine**. **Teleporting machine** is travelling by an imaginary very fast form of transport that uses special technology. Teleport machine is often paired with time travel, being that the travelling between the two points takes an unknown period of time sometimes being immediate.

I notice in this part of the world, the African continent, Western Africa, Nigeria to be preside, there are always traffics, hold-up or vehicles going slow which is being caused by potholes, bad construction of roads, traffic light not working, area boys extorting money from bus drivers which can lead to accident trying to dodge them. The police also extort money from private drivers which sometimes lead to accidents. People spend more time on the road, a journey of 30minutes, you ended up spending 3 hours, is annoying. So, if I could create a **teleporting machine**, in which is the sense of instantaneously moving physical objects or living beings from one location to another, without wasting time. The advantages are:

1. **Reduced Transportation Costs:** With **teleporting machine**, there would be no need for expensive transportation infrastructure like airports, roads, or railways. This could potentially reduce the cost of travel significantly.
2. **Environmental Benefits:** it could reduce the carbon footprint associated with transportation since it would eliminate the need for vehicles that rely on fossil fuels.
3. **Increased Accessibility:** it could make remote or hard-to-reach locations more accessible, opening up new opportunities for exploration, tourism, and economic development.
4. **Emergency Response:** In emergency situations, such as natural disasters or medical emergencies, it could allow for rapid response times and the quick transfer of people and resources to affected areas.
5. **Time Efficiency:** it would save a significant amount of time that would otherwise be spent traveling, allowing individuals to be more productive or to spend more time with their families.
6. **Global Connectivity:** Teleporting machine could facilitate greater global connectivity by making it easier for people to travel across long distances, fostering cultural exchange and collaboration.

It requires critical thinking and highly intelligence. So my invention of **teleporting machine** will be of great use in Nigeria especially Lagos and it's traffic. This can be assumed to be a faster means of travel. It allows users to access resources running on devices that are located anywhere in the world, for example: devices on third-party networks, servers behind NAT or devices connected via a cellular connection.
