MY PROPOSED INVENTION

MY name is Orekoya Pamilerin, I'm a native of Ogun state. I attend Abbot Dayspring School, Itele, Ogun state. I will like to talk about what I intend to invent.

I will like to invent the fastest made in Nigeria car which can move at a speed of 350km per hour. The engine of the car will be made from jet engine which will not require petrol or gas but solar energy. It will have a solar panel built on top of the car which will be charging the car while moving instead of stopping to buy petrol for a specific amount of money. The type of solar panel will be monocrystalline, which is the best type yet in terms of efficiency. A very powerful battery will also be used to store the solar energy for when the sun is not available. The new and improved car will serve people for long without spending a lot of money on petrol or gas. Below are some of the advantages as well as disadvantages of my proposed car.

ADVANTAGES OF THE NEW CAR

- I. It will be reliable
- II. It will be faster than any other made in Nigeria car
- III. It will be durable without breaking down easily
- IV. It will be cost effective to maintain
- V. It will not make you spend a lot of money on repair
- VI. It will not require petrol, diesel or gas to function

DISADVANTAGES OF THE NEW CAR

- I. It will be very fast hence, prone to crash if it is driven by undisciplined drivers
- II. The high speed can cause friction thereby leading to overheating
- III. Brake can fail due to over speeding when driven on bad roads
- IV. High cost due to cost of the jet engine.

I will continuously work on modalities to eradicate the envisaged shortcomings of this invention and equally improve on the highlighted advantages of this awesome project.

THANK YOU VERY MUCH
