

HOUSING:- CHANGING THE NARRATIVES THROUGH BUILDING AND INFRASTRUCTURE.

Housing on its own is an important need for the sustainability and comfort of man. Unfortunately today, housing for some people have become a major issue of concern since people barely find their living conditions favourable, safe and affordable. If I were to invent something, I would invest in the invention of a system that would coherently ensure the facilitation of housing in the society in way that it would be accessible to all.

This system would be put in place to ensure that as time and centuries go by, anyone or '*people*' who carefully colonise it would have little or no difficulty with housing as long as they are concerned. The aim of this system is to reduce the level of unavailability and affordable of homes and infrastructure within people, communities and nations.

This system would also revolve around some other important factors that would make housing options better for people. Some of these factors include; Easy accessibility of some housing materials for people's comfort: In this case, this would be achievable by making available some important building materials and housing implements generally. People are not supposed to only have houses, they ought to have houses that would make them confident and comfortable and this can be achieved by making the important materials available.

Availability of Housing Insurances: Inasmuch as so many people want to own their own houses, some others are perfectly fine with living off of a rented apartment. This system would be put in place in such a way that both those who plan on going for rentals and those who live in their self-acquired houses would have a viable insurance that their houses are safe.

Provision of Moral Support for location scrutinising: Most people find it difficult to make choices regarding the location they would live and build at. This system would make the choice of where to get or build a house to become an easier task. The aim of doing this is simple; to fix people's houses in their choice locations.

Introduction of Communal relationships: This system would also ensure that there would be access to communication and effective response from people who have also formerly benefitted from the system. This would in turn encourage peace and harmony amongst neighbours and members of the society at large.

Financial Considerations: The saying that people have different preferences cannot be overemphasised. While there are families who would prefer large houses and more space built in their homes, there might be others who may not be able to afford such houses. This system would help ensure that even with the low budget for housing, the

people would still be able to get the best of any kind of housing conditions they find interesting.

In conclusion, if I were to invent something, it would be a system that would encourage better housing opportunities and conditions for people, while putting their financial, topographic and even communal preferences into consideration.

Thank you.
