

NAME: Ughasoro Michelle Chizitaluife

CLASS: JSS1

SCHOOL: GATEWAY SECONDARY SCHOOL ENUGU

IF I COULD CREATE SOMETHING NEW

All these years, I have been struck by this one question I've always been asking myself, "What has never been invented before?" As years went by, I grew and my brain developed more and was exposed to the world around me. I began thinking big and I was finally able to answer the question.

The one thing that I don't think had ever been invented by man is all that simple. Although it took me years and time to answer this question, it just wouldn't stop tugging at my brain. It was tough but I figured it out. I'd invent something that'll inspire the next generation and more to come. I thought of this answer and although a little bit wacky it may be a step towards more innovations and ideas.

When I was younger, I wanted to become an inventor (it had always been a hobby of mine to randomly create objects with no sole purpose). I found what to make a puzzle though, because most of the things in this world had already been invented. It really wasn't easy.

I shall tell you my idea in an impeccable manner with a story line.

Held back in thought as a kid, I was lost thinking of something meaningful at that early age. I was approximately six at the time and was curious of the world around me. "What has no one made before?" I questioned myself as I walked around my compound, staring at the sky. Suddenly I was struck with a thought. 'A solar panelled phone', I exclaimed.

Five years later; just yesterday, I discovered that it had already been invented. I heaved a sigh and was struck once more with that same question. My brain tossed and toiled but couldn't think of anything. At last I sighed and calmly let my mind wonder to a possible answer. It's imaginative but when you consider it, who's judging?

My imagination wondered to the idea of possibly creating a phone that could teleport you to a loved one just by getting a call across. Through that, families would not have to feel homesick or worried as they could just teleport themselves to a loved one's location.

Scientists are still figuring out a way to teleport people from one place to another. It may be a science fiction but could become real as Arthur c. Clarke once stated: "Magic's just science we don't understand yet". Once scientists find a way to do it, it

could then be implanted into a phone or practically any device. It could make history and possibly develop the social view of what people regard as the average Nigerian.

Such invention could revolutionize the technological world and pave way for more innovations and possibilities. And although such may not yet exist, I believe that through much perseverance and more research, it can be so because through dreams come possibilities that are yet to be uncovered. All that is needed to make a fire, is a small spark!
