

NAME: Ughasoro Crystal Chikaijiaba Oyinnia

CLASS: JSS3

SCHOOL: GATEWAY SECONDARY SCHOOL ENUGU

IF I COULD MAKE SOMETHING NEW

Thousands of years, since the emergence of Earth and life, the human race has been a specie of intellect and unbound capabilities. Considering previous generations, one can't help but baffle at the immense acumen of human beings. Imagine how even by the time of our prehistoric ancestors, various tools and weapons had been invented for diverse purposes to ease the challenge of survival and although primitive, they were still effective. Development has been rocketing since then. From the ancient Aztec inventions to the Akashi records (which are fabled to be the ancient language of angels and map to a treasure in the desert). Isaac Newton's theory of gravity to current mind-boggling inventions we possess today. It's almost safe to say that everything that can possibly be invented has already been made.

I, however, don't see that as the case. Saying that everything has been invented is as bizarre as saying that amongst trillions of stars, planets, space and galaxies the only existing planets are the ones which are found in our solar system!

Being presented with the topic that I'm facing, I'd say that Man's inventions will only keep improving. Suppose I'm asked by a friend what I'd invent if given the chance, I'd simply reply: "All it takes to make an invention is just creating what no one else has ever thought of making, discovering the impossible and creating what would benefit man and his environment". But being frank, inventions aren't easy to create and require tons of effort and time as I've learnt over the years.

Candidly, I've never thought of me inventing something (tinkering has always been my sister's hobby) but for quite a while I've been pondering on it and if ever given a chance, the invention would be dedicated to the medical industry. I've always wanted to make a device that could alter negative genetic sequences in a person's DNA ever since I'd read about it. The human DNA [deoxyribonucleic acid] is a string of codes packed with more information on a person than an encyclopaedia! Unfortunately, it's been found to sometimes contain negative traits such as obesity, cancer and so much more due to hereditary or environmental factors. The purpose of my device would be to detect and eliminate negative genetic traits and replace the removed one with much needed traits. It would emit mild x-ray waves that would rewire the genetic strings while making sure not to badly rewire the DNA codes. The device would be called the E.D.R.M (Electronic DNA Recoding Machine) and could be able to save generations from negative genetic traits!

If a chance were ever to arouse for this thought to be a possibility I'd gladly grasp it, keeping in mind the difference I could make and the lives I would've helped save. For I know that no matter how small, one action can save our world. Just as Michael

Jordan once said: “Some people want it to happen, some wish for it to happen, others make it happen.”
