

IF I COULD INVENT SOMETHING NEW

My name is Theola Nobiruo Emamayie, I am a student of NEPA Staff School, Sapele, Delta State and I am in JSS 3.

If I could invent something new, that would change the world, it will be a portable, yet a useful device worn on the hand to pass oxygen to the blood of those being transported to the hospital at the point of dying. This would help to reduce the loss of lives before getting to the hospital.

Recently, people die of a disease known as asphyxia. Asphyxia is a disease caused by lack of oxygen in the blood flow to the brain. Many people also die of a disease called cerebrovascular disease. It is a disease caused by not having enough oxygen which can cause brain damage.

As a future scientist, I would invent a device and call it “blood oxygen”. It would be in the form of a technologically advanced smart watch which with a tube will send purified air (oxygen) to the arteries. The arteries would then transport this oxygen to the blood which would be carried to the brain. What then is the use of this device?

This would thereby save the brain from damage even while the dying victim is being transported to the hospital. This device is the cure for asphyxiation and cerebrovascular diseases.

Also, the “blood oxygen” device is designed to help the victim still be conscious and breathe while receiving treatment from medical personnel (s). It will help to ease the doctor’s stress as the brain and heart will function properly which will aid in easy recovery of the patient.

Furthermore, this device is also invented to replace the nasal cannula and the oxygen mask. The nasal cannula and the oxygen mask can be used in the hospital to help patient get oxygen when they do not have enough of it whereas my invention “blood oxygen” can be used even while patient is being carried to the health center to prevent the damage of the brain or other vital organs in the body.

Lastly, I would make this device cheap and affordable to all and sundry. For example, a neighbor of mine died because there was not enough finances to buy the oxygen mask while He was being treated after having a fatal accident. It hurts me see people die of disease such as asphyxia and so on because oxygen is a gift from God. These are the reasons I want to invent this device.

In a nutshell, I would like to help the world and humanity using this device to save millions of lives. My invention would be of great help and beneficiary by passing oxygen through the blood to the brain thereby saving it from damage while patient is being transported to the hospital.
