

IF I COULD INVENT SOMETHING NEW

NAME: OBIECHINA PRECIOUS CHISIMDI

SCHOOL: HARVEST OF KNOWLEDGE SCHOOL

CLASS: JSS1

As the given topic refers, I would like to invent water engine of a moving vehicle that will be using ordinary water instead of petrol or diesel. These vehicles will not be producing smoke from the exhaust pipe and by so doing humanity will be safe from environmental pollution unlike petrol or diesel which produces smoke that add to environmental pollution that is dangerous to human health.

With this countries resources can be saved from spending so much in controlling environmental pollution. Rather resources can be channeled in more productive areas such as health education agriculture tourism sports critical infrastructure etc.

In health facilities will be put in place to attain high standard of health condition which enables the people to fulfill their lifespan.

Education as it goes give the highest dividend. The means that upon the very high standard of education now available people will grow deep in knowledge which will make them become creative in different of human endeavor knowledge is power.

Agriculture is another area that develop a country fast there is a saying that **NO FARMER, NO NATION**. This shows the importance of Agriculture to any Nation Developed Countries give great attention to agriculture because of its enormous potential to investment leading to development. A developing country like Nigeria need growth and development in agriculture to attract both local and foreign investment which facilities the growth and development of her economy.

The product of agriculture can be processed to produce different types of products that can be exported to earn foreign exchange.

Tourism is another area that is vital to developing a countries economy. A country that does not have natural resources like: crude oil, coal gold etc. but rich in tourism attraction has the potential to attract investment that will be a good avenue to develop her economy; good example is Kenya Sports, is another good area for attracting huge investment. Country hosting one sporting event can earn substantial amount of money from people who travel from another part of the world to watch the event people pay to have access to watching the event. It projects the image of the said country in good light.

Critical infrastructure development is a good means of developing a Nations Economy Provision of good road network electricity good water supply etc. Is a good way to enhance economic development constant supply of electricity promotes industrialization which can

make a country become a producing Nation. The exportation of products of the country to foreign market will generate foreign exchange.

It will also generate employment which will go a long way to reducing insecurity problem of that country for example: Nigeria.

My invention will drastically reduce the current high price or cost of petrol as it's in Nigeria. All other goods and services will be inclusive in cost reduction for the benefit of humanity.

I thank the organizers of this topic for participation.
