

IF I COULD INVENT SOMETHING NEW

What is an Invention? According to Britannica.com, invention is the act of bringing ideas or objects together in a novel way to create something that did not exist before.

The device I would like to invent is known as “**Special Diagnosis Goggles**”. It will look just like the goggles professional swimmers use. It will be used strictly to diagnose any type of sickness in the body of whoever puts it on. It would be worn on one’s face with the ability to tell the person exactly what illness the person is suffering from or the cause of one’s disease.

The goggles will be fitted with a special ear pod that will allow it to communicate the findings to the person who is wearing it. It will be fitted with special sensitive cell membrane that when come in contact with the person’s eye can automatically dictate and describe not just the symptoms but disease.

The benefits of this device are many:

Firstly, it can easily dictate and reveal to the owner whatever sickness they have.

It also save the cost and time of people for having to go and sit down in long queues in hospitals or diagnosis laboratories to carry out medical checkups.

It will reduce the number of sudden death.

The case of my aunt inspired the invention of this device. She had complain of ‘light pain’ in her chest every time she wakes up. However, she did not take it seriously, till one faithful morning, the pain was severe that she couldn’t turn over in the bed.

She send and bought local herbs (locally known as ‘Agbo’) and drank but the situation got worse and she died.

Later it was discovered that she had high blood pressure. This story is typical of many others in Nigeria.

These my invention “**Special Diagnosis Goggles**” would be able to solve such cases.

Equipped with AI chips it can carry out complex text like:

Liver function test, glucose test, blood count test, creatinine test, body count test, urine acid test, serology test etc.

By wearing it on someone’s face, it can dictate accurately how many weeks or months a person is pregnant. It will also give you urine analysis.

My intention is to make this device available to every household at a minimum cost. Armed with this device, one does not need to go to any hospital to carry out a comprehensive medical checkup which according to my teacher cost a minimum of twenty thousand naira (N20,000).

This “**Special Diagnosis Goggles**” will have the ability to access your well-being and give you accurate diagnosis.

In conclusion, if I could ever invent something new, this device will be my ultimate brain child. As it will reduce the likelihood of surgery and going to the hospital. Most importantly, it will prevent emergency of bigger health issue and sudden death.

Thank you.
