THE M.E.X CICERONE PAD

My name is Munachiso Ethan Xavier Egemole. I attend Radiance High School, Festac Town and I am currently in JSS 1. If I could invent anything, it would be the M.E.X Cicerone Pad. It is a pad that enables you to interact with your role model.

As children growing up, we learn about a lot of great men and women who we regard to as our heroes or idols, and we want to be like them. Some of them have passed on, and more of them who we may never get a chance to meet in person except through their books or any material written about them. This invention works like Frequently asked questions (FAQs), but the edge to it is that it brings your role model to you via an Artificially Intelligent and interactive hologram.

My invention is made possible with a combination of three different technologies:

1. Your everyday device, either your phone or pad (tablet).
2. Artificial Intelligence (AI) putting together all materials including videos, journals, scripts, etcetera of role models and creating an intelligent, yet personalized video format for us users.
3. My application that displays all the collated videos and demonstrations in a real life Hologram.

Ideally, one's role model may never be reached throughout a life time. Or they could possibly even have died. That's where this invention comes in handy, by bringing interaction and learning processes with your role models, converting them to almost physical mentors and coaches who can personally relate with you on specific needs. It is several steps further than ChatGPT-4 on your phones, as you will be able to communicate with your various role models in hologram form, as if they are right there with you.

Let me give a typical example:

You are a lawn tennis enthusiast and your role model is Rafael Nadal. You are trying to learn a backhand top spin stroke in tennis, but you don't seem to get it right. You bring out your Cicerone pad, open the application and ask 'Nadal for a coaching lesson.

‘Nadal then responds with a personalized video demonstration in the hologram, “It's easy. Just swing your hand forward, while it faces left. Just like this”. And with several try outs, I become proficient at it.

This invention will increase positive and active learning with customised demonstration from the heroes and role models we admire as well as a useful application of our time.
