

Name: AKIN-TIJANI NADIA ADEOLA

Class: JSS 1

School: BARAKAAT COLLEGE, IBADAN, OYO STATE

If I could invent something new, I would create a device that detect and identify thief, armed robber or anybody who perform any corruption acts, and I will call the device a "Corruption Detector," which would have the ability to detect criminals in our society.

Some days ago, money from our piggy bank in our house was removed by unidentified person. I cannot say the real person but I was suspecting our neighbour's children whose parents are not buoyant of feeding the family three meals' square but the children do spend lavishly when they have money. The corruption detector would reduce the criminal acts in our society when everyone knows such device will identify them.

The detector would consist of an electrical and electronic box with which a small computer screen is connected to, and a thumb printer would also attach to the device. The device would have a sensory programming which will enable it to identify the criminals when individuals place their thumb on it, thereby displaying the number of times one has performed a criminal act or detecting a criminal in a particular theft.

This would serve a lot of purposes which cannot be counted. It would reduce investigation so much for the police to quickly come to a conclusion that someone is a criminal of any offense. Likewise, it will reduce a lot of adjournment cases in the court of law in the process of proving the suspect guilty.

Moreover, a lot of places could get this device which can be placed at their exit to show a criminal, places like schools, banks, places of worship, and so on. In the school during examination or any examination hall, this would identify students who cheated during the course of examination. In the place of worship, it would indicate those who steal phones and money, among others. This would sanitize our society free of criminals.

And it will also provide job opportunities for people who are selling the corruption detector while it will enhance our economy status.

In conclusion, the corruption detector would be a nice innovation that would reduce corruption to the bearest minimum in our society and I believe it would make our society better.
