### **IF I COULD INVENT SOMETHING NEW**

“I could invent a Time Machine”. What is a time machine?

A Time Machine is a machine that moves someone to the past or the future. It depicts the development of the human species and time travel through the theory of relativity, as defined by the concept of true science fiction. Time travel is the hypothetical activity of traveling into the past or future, it is uncertain whether time travel to the past would be physically possible. Through this knowledge of making a time machine, it would be possible.

Time travel will enable the time traveler to resolve historical debates and verify how things did or didn't happen by studying past errors and their consequences. Also, by examining the past, we gain valuable insights that can enhance our understanding and approach to the present and future.

Time travel also has its downsides, if unrestricted time travel were possible, it would lead to a complex breakdown of rotational order of things. The ability to travel to both the past and future would upend our understanding of time. On the part of the time traveler a careless alteration or any contact with past self may alter the complete flow of time and result in a different and unpredictable future where even the time traveler himself might cease to exist.

According to Stephen Hawking's "Chronology Protection Hypothesis", it suggested that there might be natural laws preventing unrestricted time travel.

In conclusion, time travel is a very interesting concept and thinking of the fact that we might be able to time travel one day is very fascinating.
