## **IF I WERE TO INVENT SOMETHING NEW**

**By**

**Eze Ugochukwu Victor C.**

**Class - JSS 3**

**Amazing Love International Schools Enugu**

I have seen and heard of so many inventions of many great people in the world both in the past and present day. I have taken note of the usefulness of their inventions. According to Encyclopedia Britannica, invention is the act of bringing ideas or objects together in a novel way to create something that did not exist before. If I were to invent something new, I would like to create a system that addresses a pressing global issue, leveraging technology to promote knowledge through which poverty will be reduced and possibly eradicated in the world.

If I were to invent something new, it would be a computer application which I chose to call MaxiTrainer. This application will play a major role in the promotion of knowledge and education. MaxiTrainer will use Neural Networks and Data Mining algorithms. Neural networks and data mining will enable the application to access people's learning patterns and assimilation rates, this will enable different people without proper knowledge on how to use technology to be taught and trained properly in a short time.

This invention will reduce the unemployment rate which is causing a lot of crime and violence. When citizens receive adequate training/ education they become productive, contribute to the nation's economy, and generally reduce poverty. Reducing poverty will reduce many problems such as thuggery, crime, corruption, and many others. Many of our youths are now indulging in one crime or the other or working as thugs for politicians to survive. This is an effect of poverty, but if the MaxiTrainer is used it will go a long way in training these youths in any chosen skill and this will help to reduce poverty

The MaxiTrainer can be used to increase security and enable countries to defend their territories from external and internal attacks. This will be done by using neural networks to analyse the enemy's combat behaviours and to create combat simulation models. This can be used to train soldiers and law enforcement agents in the most efficient ways. This will cause peace within countries thus fostering unity. This will be useful in the sub-Saharan African region where insecurity has created so much poverty because of the activities of terrorists.

The MaxiTrainer will help in the training of individuals in multiple occupations, and it will also be very useful in the business sector by making accurate sale forecasts, by monitoring customers personal details and shopping patterns. This will greatly improve the economy of developing nations and provide great financial opportunities for companies all over the world. This will make investors from all over the world to feel safe to work with developing nations like Nigeria thus improving international relations.

In conclusion, if I were to invent something new, I would invent the MaxiTrainer application which will help to reduce poverty through education by creating job opportunities, reducing violence and crime, defending against war, and developing the financial and economic sectors of nations.
