

Name: Atu Chidiogo Lilian

School Name: St Catherine's Comprehensive Secondary School Nsukka

Class: JSS 2

IF I COULD INVENT SOMETHING NEW

What is invention? Invention can be defined as the act of creating or bringing something into existence by our creativity in order to prefer solution to a problem. If I could invent, I would love to invent a robot (human – like computer). A robot is a machine that has the capability of doing human- like works and is usually controlled by a computer. They make use of artificial intelligence (AI). Here are some reasons why I would love to invent a robot, it's availability, it's error reduction, it's communication efficiency, it's ability to fight was and so on.

First and foremost, I would love to discuss robots availability, robots are machines that have all the time doing nothing except when needed by its owner, and they do not get tired and are always disposed to help out. They perform domestic chores and other works in the house. I could remember a day I was so famished and exhausted and at the same time wanted to wash, assuming I had a robot; it could have easily done the washing. Robots also known as human – like computers in some cases replaces people, that is, they do work meant for human beings. This helps to relieve individual from work burden thereby expanding individual's life span, and also makes them happier and healthier.

Reduction of errors, robots with the use of its artificial intelligence tends to be more smart and accurate. Robots help in a lot of field to provide accurate result. In our daily lives we humans make mistakes but robots when well programmed helps to minimize errors and are in most cases 99% accurate.

Thirdly, robots when properly programmed can be used to fight both internal and external wars. In movies today robots are used for battles and this can happen in real life. When robots are used for wars, humans will no longer be needed and it will save human life and make man to live longer. For instance, during the World War I and II, lots of lives were lost. If robots were use during these wars life couldn't have been lost that way. Robots also protect and safeguard properties and residential homes.

Finally, robots are used as means of communication. Robots are smart enough that they can convey information from one person to another, instead of town criers; robots can be used to transfer information to people.

In conclusion robots are necessary in our daily lives because of its availability, error reduction, fighting of wars and communication efficiency. Therefore if I could invent, I would love to invent a robot.
