

IF I COULD INVENT SOMETHING NEW

Corruption has been a bane on Nigeria development since independence. What is corruption? Corruption can be defined as the dishonest or illegal behaviour especially among people in power; this does not mean those who sell their vote are not corrupt, they are also corrupt as the presidential candidates who bribes electoral officials to win an election.

One of the challenges of this great country {Nigeria} is corruption. If I am given the opportunity to invent something new, I will invent a device called Corruption Detection Scanner {CDS}. Which will detect if someone is correct or not, as often seen bank sectors. This will help in many ways.

In the area of chosen leaders, it will be easier because during the election, this device {CDS} will detect people who are involved in corruption and prevent them from voting, and disqualifying candidate's found guilty of corruption. This will mark death of corruption in the electoral sector of Nigeria, the birth of a free and fair election and also the birth of a corrupt free Nigeria. This will bring a dramatic change in Nigeria and in the world at large.

In the health sector, the presence of corrupt free leaders, there will be qualified doctors, enough resources and medical equipments for hospitals. The elimination of corruption will enable the government save more money which may be invested in research for new cures; artificial intelligence {A.I} which will help in searching for new cures and bring improved medical care for the teeming population.

When corruption is eliminated through the Corruption Detection Scanners {CDS}. Money previously wasted through inflation of contract sum and kickbacks will be conserved and be put into projects like providing infrastructures on roads, rails, electricity etc. This will in turn bring about a reversal in economy and on the well-being of Nigerian citizens. Also, the lives being wasted on our roads on daily bases as a result of accidents due to poor constructed roads and bridges as result of nepotism will be saved. The same with poor infrastructure will also be replicated on aviation, electricity and railways.

If the device {CDS} is deployed by Nigerians, it will be a major stroke especially in education sector. Corruption has eaten into the fabric of Nigeria as a nation. If corruption in education sector is reduced through the device {CDS}, the money saved will be injected in funding education from the primary level to the tertiary institution. Corruption has made exam malpractices, sex for marks, admission racketeering order of the day. If education is revolved in Nigeria, it will be a catalyst for Nigeria's development. There will be improvement in personnel

and equipment for examination. Therefore, examination will be conducted without cheating.

In conclusion, the Corruption Detection Scanner {CDS} offers a ground breaking approach to combating corruption in Nigeria. By harnessing technology and biometrics, we can enhance transparency, accountability and justice fostering a more equitable Nigeria and world at large. Thanks
