

IF I COULD INVENT SOMETHING NEW

According to Oxford Advanced Learner's Dictionary, the act of designing a device that has never existed is to invent. It is also defined as the producing of something useful with the use of imagination. So many things have been invented and they are very useful to the world such as; mobile phones, cars, ships, etc.

With the use of imagination and knowledge, I want to invent a device called Hydro-electric generator. This device creates electricity with the use of water instead of petro. This device makes it easy and comfortable for having enough electricity and with the help of this device, electricity will not be a problem to the country

It also can be able to provide electricity for about ten to fifteen hours and it is operated by tapping on a screen. The batteries are powered by the speed of the wheels in the engine and thereby creating electricity of high current. If more than thirty liters of water is added in this device, it will not work normally again which will also bring about the damage of some parts in the engine.

This device has up to ten spark plugs and twenty batteries in the engine. It also gives signs for you to know when it is running out of water or breaking down. It also has a sound recorder where you can command it to turn on or turn off. If current is low this device has a place you can make the current high. When this device on, you must not add any water to, first off it before adding any water to it. This device should be kept away from children to avoid harm on them. It also should not be kept near explosive things like gas because if it explodes, the device may also explode which will lead to the death of some people around that area. Before use, first read the instructions before this device can be operated to ensure the good working of it.

This device will be useful to the country because it makes use of water which is a natural resource that cannot finish and it will be of good help to industries in providing electricity. With the help of this device, electricity created will be able to be used by twenty houses which again will help in the reduction of high rate of no electricity in the country. Also with the help of this device, Nigeria will become advanced and people will enjoy electricity. It will be very beneficial to the country for people to avoid paying electricity bills and also help in providing electricity to various homes, schools and industries.

In conclusion, this technology gadget will be of good help in providing electricity with the use of water which can easily be found. It also will help in the reduction of costly issues for our families on electricity in our country which also will help in the development of electricity in Nigeria.
