

If I Could Invent Something New

If I could invent something new, I would invent a garment that can generate comfort and fresh air for everyone, everywhere. This garment which I call "Atmo wears" would be able to keep people cool and warm all day long.

Atmo wears is an invention that is weather sensitive, so whenever it is cold, it generates warm air and when hot it will generate cold air. It comes in different patterns and looks just like any regular cloth, but there are little microchips placed inside it. The chips are placed underneath the fabric during production and distributes air or heat when necessary.

Atmo Wears provides the user with air and heat at various times, it effectively reduces skin temperature, heat, stress and enhances free ventilation. It absorbs air from the atmosphere and changes its temperature depending on the weather/season. In addition, Atmo wears has zero environmental negative impact, it takes contaminated air, purifies it and generates hot or cool air. The maintenance of Atmo wears would not be like that of other clothes. This kind of cloth would need to be machine-washed, which may not be a problem, as these chips are waterproof and it prevents damaging of the chips. If it must be hand-washed, it should be gently handled. It prevents air pollution and reduces

greenhouse gases in the air. If up to 90% of the globe use Atmo wears, there would be a significant reduction in the amount of greenhouse gases in the air, thereby making it safe to breathe. It would reduce the excess carbon(IV)oxide (carbon dioxide) in the air. Safer air for plants and animals equals to better life, making them in large quantities like billions would require a helping hand from other countries and even continents, not just Nigeria because it will not only benefit Nigerians but everyone around the globe. If I am given the opportunity to make it, I could improve the world and generate a lot of money. Even the poor people in the society would use it. It would also save water because many people shower up to four times a day, but with my Atmo wears, people won't feel the need to shower excessively. It provides the user with fresh air, eradicates body odour and keeps the user and the garment fresh and warm. The garment automatically changes it's temperature thereby keeping the user comfortable in any weather condition.

Developing Atmo wears would require significant investment and collaboration with experts in the clothing industry, climatologists and manufacturers of technical fabrics. The cloth would need to be designed to be durable, comfortable, easy to maintain and affordable for all. It also

needs accurate environmental monitoring to check the weather which would be used to produce the microchips in many different laboratories.

In conclusion, if I could invent something, I would invent Atmo wears, a garment that creates lasting comfort for everyone, everywhere around the world.
