

IF I COULD INVENT SOMETHING NEW

The common yet prominent challenge of all humans is sickness. The young and old, the rich and poor, male and female, black or white, irrespective of your race. According to science daily, ninety-five percent of the world's population has health problems, with over a third of the world population having more than five ailments. Some of these ailments can be cured and some cannot. So, if I could invent something new, I will invent a machine that can diagnose and treat all illness.

This Multi-functional AI Health Machine, will be able to diagnose any illness using; urine, blood, stool, saliva, hair, or any other easy to get sample. It will also be able to scan and x-ray the entire human body and bones. So as to make all internal organs hundred percent visible. Once a patient is examined this multi-functional AI Health Machine will detect the illness, state the possible causes of such illness and list out drugs to be administered for its' treatment. If such drugs are not in existence, it will recommend Active Pharmaceutical Ingredients (API), diets, therapy and remedies to cure such illness. The machine will also enumerate measures to prevent the reoccurrence and further spread of such illness.

If this Multi-functional AI Health Machine was already in existence, it would have saved the world from deadly pandemics like; Ebola, Covid 19, Cholera, Bubonic plague, smallpox and influenza and also bring to an end incurable disease such as Asthma, Adrenocortical carcinoma, arthritis, cancer, Diabetes, Epilepsy, genetic disease, Hepatitis B, HIV/AIDS, Leukemia, Polio and many more. Many lives will be saved and families will not have to loss their loved ones. Great destinies and talent will not be lying waste in the grave ward. O HOW I WISH I COULD MAKE THIS MACHINE!

A machine of this capacity would not be affordable and accessible to the poor and those in rural area due to it technicality and high manufacturing cost. Therefore, I will partner with the federal government of all countries; beginning from African countries, Health sectors, NGOs, philanthropist and all who will be willing to sponsor and assist in making this machine accessible to all. The distribution will be from federal Hospitals, to state, down to local government health centres and private hospitals. There shall also be an intensive training section majorly for the youth on how to operate this Multi-functional AI Health Machine. This will be another form of youth empowerment and a means of creating employment.

I may not be able to make this machine now but when I grow up, with my knowledge of medicine as a potential doctor and the help of researchers, engineers and scientist, I will definitely attempt to produce this machine. However, if the machine is invented before I come of age, I will be extremely happy as it can never be too early to save a life, I will also endeavour to be among those operating this life saver machine.
