AGE: 12

CLASS: JSS2A

SCHOOL: QIBLAH HIGH SCHOOL

IF I COULD INVENT SOMETHING NEW

If I could invent something new it would be an item of equipment by which we could detect shortcomings of any event which could be hazardous for our environment. So any equipment item which can tell beforehand that certain event can be dangerous for our environment and by that we can stop it and prevent further damage to the atmosphere remains my great dream. I call it Disaster Detecting Machine or DTM. By this invention, the entire humanity will be benefitted.

Nowadays, more and more people are using petroleum-powered automobiles whose fumes destroy human health and the environment because of its chemical composition. They also damage ozone layer which can protect us from harmful ultra violet rays. Deforestation has also added to the problem. There are serious attacks from all the sides on the nature. Our successors will be in grave problem because there will be more and more calamities. Global warming has constituted a great threat not only for some endangered species but also for all living beings. There are temperature variations in all the seasons in every part of the world. For example, there are a lot of islands being formed out of glaciers as a result of high temperature.

The problem needs a quick and effective solution. I think we need such an instrument which can help us by warning us prior that certain event is dangerous for the environment so that we can stop such activities beforehand and forestall further damage to the earth's ambience. For example, if we had a machine which could have told our ancestors that deforestation may lead to such problems; or they might have known the effect of construction of dams on the environment on future generation, they would not have done that. By inventing such an instrument, I would be able to, at least, delay the natural disasters in coming future.

In the conclusion, I will say invention of such a machine which can detect that particular disaster (deforestation) and save present as well as the future humanity. I think it is the duty of every human to contribute towards the safety of their atmosphere. If I could get a chance I would love to protect my surroundings in every possible way.
