

ESSAY: IF I COULD INVENT SOMETHING NEW

My name is Oduge David, and I am a **JSS 3** student at The Great Achievers International School. If I could invent something new, I would invent a cure for **HIV**.

HIV (Human Immunodeficiency Virus) is a deadly disease that has claimed millions of lives worldwide. It is a terrible disease that weakens the immune system, making it hard for the body to fight off infections. My heart goes out to those living with **HIV**, and I wish there was a way to end their suffering.

That is why I would love to invent a curative drug for **HIV**. Imagine a world where people living with **HIV** can take a pill and be completely cured! It would be a game-changer.

My drug would be called “**HIV-cure**”. It would work by attacking the virus directly, killing it off completely. It would be easy to take, maybe just a small pill once a day. And it would be affordable, so everyone could access it.

If I could invent a cure for **HIV**, it would bring so much joy to millions of people around the world. People living with **HIV** could live normal lives again, free from fear and stigma. They could spend time with their loved ones, go to school, work, and achieve their dreams without worrying about their health.

Inventing a cure for **HIV** would be a dream comes true for me. It would show that young people like me can make a difference in the world. We can use our talents and skills to create something amazing that changes lives.

In conclusion, if I could invent something new, it would be a curative drug for **HIV**. I believe that together, we can make the world a better place, one invention at a time.
