

STUDENT NAME: AMEMTENAAN .O. GODSDWELLING.

SCHOOL NAME: REHAMA ACADEMY (J.S.S.2)

ESSAY TOPIC: IF I COULD INVENT SOMETHING NEW.

If I could invent something new that will be very beneficial to society and mankind, it will be health related invention. I will create a machine that will be able to detect when one has cancer and the part of the body affected with the cancer without the individual having to visit the hospital for examination it will be called a cancer tracking device

Moreover, cancer is the second most deadly disease in the world following that of heart disease which is the first. It have killed over 800,000 people in one of the latest statistics and needs to be taken seriously by the individuals, health workers, government, and the whole society.

Since what makes the body produce abnormal cells is not known in some cases it is necessary than quick identification is done in order to save lives from being lost. This idea was generated when my father said I should bring his blood pressure machine for him to examine himself , this led me to a deep discovery that the reason many die of cancer is not necessary that they do not money or finance or there is no cure or any way of managing it but it is because they have realized it late and therefore making difficult to start their treatment later which will surely lead to their death or by the intervention of a supernatural being which can be able to save them .

However, this study examined a rural area setting in Africa precisely in Nigeria where many are not even aware of the existence of a disease called cancer and realizing that they have cancer is definitely going to be a big challenge. For instance, if they have cancer they will think it is an ordinary malaria, typhoid or whatever comes into their mind through the advices and suggestions by their family, friend and relative or fake doctors and physicians.

But with the production of this machine easy tracking and treatment of these diseases can be achieved. Never forgetting that every good thing has its own effect, this machine or cancer tracking device will also make lazy to seek advice from medical practitioners but the good in it does is fast tracking of disease most especially. The area of the cancer will save a lot of lives. The health workers and government, mass media also have their role to play in advocacy and spread of the existence of the cancer-tracking device to those in the rural areas and interior communities in Africa, Australia, Asia, North America, South America, and every nook and cranny of the world. It will really be an awesome discovery.
