

If I could Invent Something New

Innovation has always been a gift to mankind. Issues in our lives have always compelled man to create new solutions to our problems, whether in our economy, environment or otherwise. If I could invent something new, I would invent a machine called 'TWR' which stands for Technical Wastes Recycler.

The TWR is used to collect and recycle our wastes. A lot of us are used to throwing our trash outside, so this machine is invented to be able to make a place in our houses. The Technical Wastes Recycler is very fast and creative in what it does. This is because it can turn your garbage like bottles, paper, etc. into unbelievable things that can be used for decorations.

The TWR is very beneficial to mankind. It will combat majorly, littering. As we all know, dumping of garbage can cause pollution. Most times, we throw our wastes on the road, in the water and so on which can cause air, water and land pollution and this is very dangerous to our health. If we have this in our houses and workplaces, our environment will be safe and clean for habitation.

In conclusion, in a time where most societies are battling with environmental issues, the impact of TWR would be felt all over if properly engaged.
