

My name is KOSOKO MARIAM ADETATO, I am a member of J.S.S.2G and I attend Ajara Junior Grammar School, it's with great joy and enthusiasm to receive the opportunity to write on the topic which says "IF I COULD INVENT SOMETHING NEW". It would really be a great benefit to mankind if the invention of some new outstanding home equipment which are rechargeable cooker, A non-electric blender and rechargeable iron.

Imagine having a cooker that does not require the use of refillable gas immediate electricity. In the past, people had to go through the street of going to the forest to cut down firewood just so they could survive, although technology advancement scientific research has brought about stores, refillable gas cookers and electric cooker but I don't still think that is enough to live a better and comfortable life because those inventions are limited only to the poor who cannot afford to pay for the high cost to buy or refill the gas cooker or sufficient funds to the electricity bills with the invention of a rechargeable cooker everyone will be capable of having access to an easy made cooking equipment. The invention of a new rechargeable cooker is of more advantage to stores, refillable gas cooker or even electric cookers. Its advantages over store is the less stress and reduced cost of getting kerosene, some people travel long distance to buy kerosene because most filling stations are always sited far away from the residential places. Also, there will no longer be to pay for refilling gas cooker and then its major importance is that when you charge your rechargeable cooker, it can still be used even in the absence of electricity. You don't have to wait any longer for the electric light to be turned on handed to preparing any meal.

Having the chance of creating a non-electric blender indeed will change the life of every body because it eases the lives stress of grinding with the mortar (traditionally as "olo" by the Yoruba's). It also reduces the reliance of people on electric light. A non-electric blender that can blend anything an electric blender can blend would be so amazing to invent.

In addition. A rechargeable iron also will help to change the stressful atmosphere. A rechargeable iron is most useful to everyone it is useful to children who go to school, laundry works, the fashion designers who iron their customer cloths, famous celebrities such as the musician actors and so on stage wearing rough and tattered cloths and most especially business women/ men who can't sit at home and wait for the electricity power to switch on so as not to appear late at about new changes.

In a nut shell, I write to let you know that if the ball was in my court to invent something new I would really like to improve the quality of living.
