School: EVERGREEN COLLEGE, ENUGU

Class: JSS 2

IF I CAN INVENT SOMETHING NEW

In the real world, people are facing so many challenges in life like blindness, making it hard for people to work and get money which makes them lose hope and end up killing themselves all in the name of blindness.

I want to invent an AI not only to take over the world or provide human needs but help the blind people, become something good and meaningful in life at least for their children's to take over their land and pass it on to the future ahead.

Inventions can be anything you dream of doing but help children with learning and understanding. AIS are like fun people who can help us do anything and this is one of the things I want to achieve in life without anything holding me back.

I know that robots or AIs can make some people lazy, but the one I want to make is specifically for the blind people. Even without robots, I know that some blind people worldwide have given up and some still pushing hard at least, making progress in life.

I want to be known for helping and being kind to, people but not to invent what I do for myself just to gain money. Though that, it can be an easy way to get money but it is better if I die, I can be known for something great in life and maybe, build a sculpture for me.

I am a child of God, dedicated to help people and become something great in life. Even though I know my story is sad because, I am having problems with my educations, I won't let it bring me down and neither should I let it bring other people down especially the blind.

In the case of their blindness, I will modify the robot in a way, that any given time or voice commands given to them. I can also program them to know when their owner is sick or not giving them all the essential things they need.

Technology has been either (Good or Bad) for people, sometimes use it in an evil or good way but the one am going to make won't be for evil use because, I will program it to be able to detect if anyone is trying to use it for the evil it can able to self-district before it causes harm.

Technology can improve education because, for blind people, it can help them start learning to have enough education and brain, at least to teach their help their children so they won't end up like them in the future after they get old and have given birth.

AI is revolutionizing the lives of the blind by breaking down barriers to information, navigation, and communication. These technologies illuminate new pathways to autonomy, access to resources, and social inclusion, significantly enhancing the overall quality of life for visually impaired individuals worldwide.
